

2/27/2026

Basic set up of navBounds, camera, scenemanager, character, and walls for restaurant.

- In this Point and Click package, I could just create a blue print child to copy and edit it.
- All I had to do was set up the environment for it.

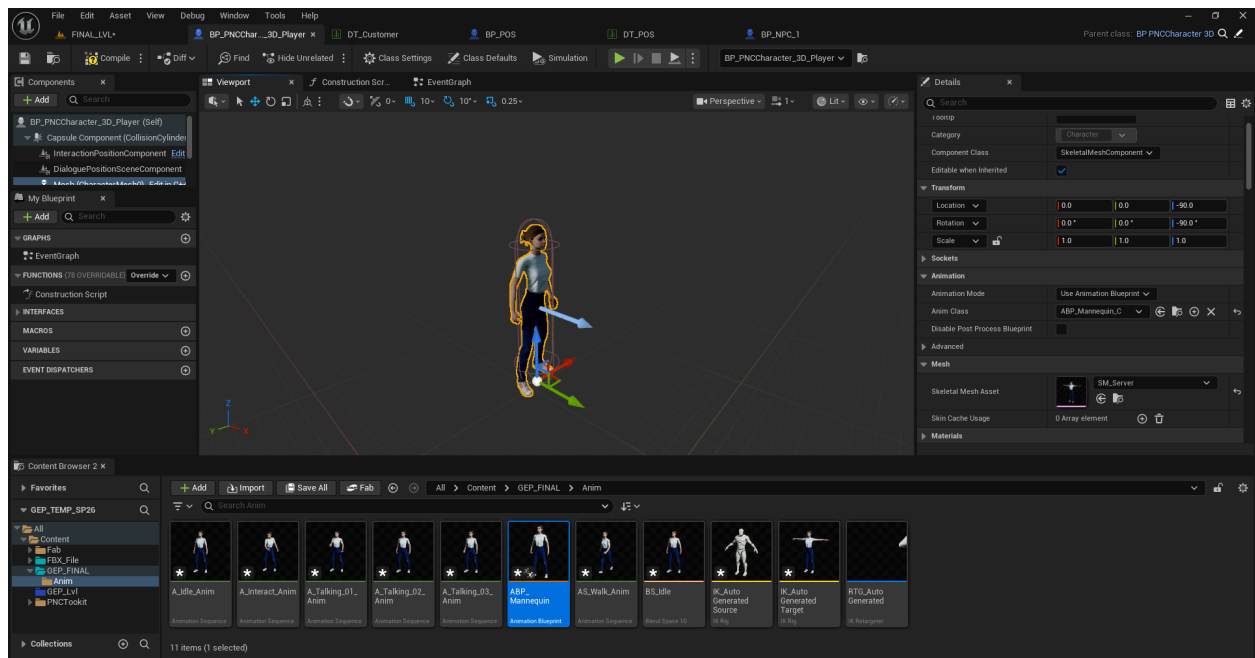

Through that rectangular hole, the player will receive the food or send the order to the kitchen. There will be a POS Computer set up for players.

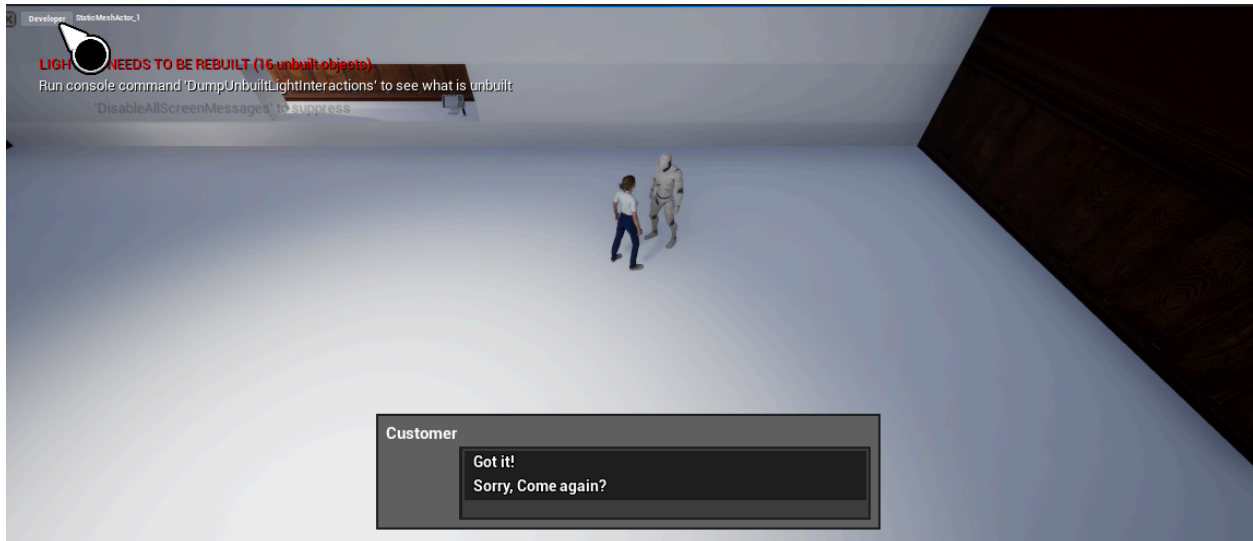

Importing Character Model

- I found the FBX file from [Mixamo.com](https://mixamo.com)
 - I had to check on three other FBX files but they did not somehow fit the animation that this template used.

Dialogue with customer

- Customer NPC will say their order such as pizza & soda, hot dog & soda, or chicken & soda. If the player remembers it, clicking 'Got it' will end the dialogue. If the player wants to see it again, the NPC's dialogue will be re-open.

Dialogue with POS

- I located another BP_NPC and removed the skeletal mesh to make it seem like the player is talking to the machine.
- By clicking one of the options, the order will be sent to the kitchen.

I have to locate more props and lights to make the restaurant atmosphere.
Also, changing the NPC model!
